One can only imagine what these ingredients might do to an infant whose body organs are all "premature" (still developing). No toxicological tests have ever been performed on the vaccines themselves, and no trials prior to licensing have ever been performed on infants.

Flu Vax Facts YOU Should Know

● ***The Idaho Observer*** has published urgent information concerning pandemic flu preparedness and the China connection.

<http://www.proliberty.com/observer/20080714.htm> tells this story, showing the connection between Sanofi-Pasteur (a pharmaceutical company producing flu vaccines), Communist China, and the current preparations for the flu pandemic. For information regarding the avian flu vaccine and pandemic, please see:

<http://vaclib.org/images/videos.htm#avianflu>

● According to an August 1, 2008, **Sanofi-Pasteur** press release, "Approximately 250 million people, or 4 out of 5 residents of the U.S., are recommended to receive the influenza vaccine annually."

● **Studies show that flu vaccines do not prevent the flu in either children or the elderly.** To determine the value of flu vaccines for children, Tom Jefferson, MD, and colleagues at the Cochrane Collaboration, an international organization that evaluates

medical research, looked at over a thousand studies. They selected 14 high-quality clinical trials in which vaccinated children had been compared with unvaccinated children. The combined results of these 14 trials were reported in the British journal *The Lancet* (2/26/05). Their conclusion: "We recorded no convincing evidence that vaccines can reduce mortality, [hospital] admissions, serious complications, and community transmission of influenza."

- The CDC now recommends flu vaccines for babies 6-23 months because they tend to suffer more complications once they get the flu, however no evidence supports the recommendation. The Cochrane reviewers found that vaccines had little effect on bronchitis, ear infections, and hospitalizations, compared with the babies given placebo vaccines. In short, the CDC recommendations are irresponsible given the fact that the only two studies that involved babies found no benefit and little is known about adverse effects of these vaccines on babies.

- The review follows on the heels of a study that looked at three decades' worth of data and found that vaccines for the elderly are not as effective as previously thought. And contrary to conventional medical wisdom, vaccines do not reduce flu-related deaths in elderly people.

- MedImmune is producing about 12 million doses of FluMist for the 2008-2009 flu season. This thimerosal-free live attenuated influenza virus nasal vaccine (LAIV) was approved for children as young as two years old. Their intent is to increase the total number for each subsequent flu season.

FluMist: "One of the most troubling concerns over the injection of this 'chemical soup' is the potential for the viruses to enter directly into the brain. At the top of the nasal passages is a paper-thin bone called the cribriform plate. The olfactory nerves pass through this bone and line the nasal passages, carrying messenger molecules to the brain that are identified as 'smells' we are familiar with. The olfactory tract has long been recognized as a direct pathway to the brain. Intranasal injection of certain viruses has resulted in a serious brain infection called encephalitis, presumably by direct infection of the olfactory neurons that carried the viruses to the brain." * Time will tell whether the live viruses in **FluMist** will become linked to cases of encephalitis." [* Knipe, David. M. Ed. *Fields Virology*. Philadelphia: Lippincott, 4th ed. 2001. pg. 1057 (Quote above is from the article: **Risks of FluMist Vaccine: Nothing to Sneeze At**, by Dr. Sherri Tenpenny, October 2, 2003, © 2003/2009 by NMA Media Press. www.nmaseminars.com)]

- **FluMist** recipients should avoid contact with immuno-compromised for at least 21 days due to viral shedding of the live influenza viruses. **FluMist's** most prevalent side effects are runny nose and nasal congestion. It should be noted that over 60% of the U.S. population would be considered "chemically immuno-compromised."

- The CDC's cost for a mercury-containing vial of flu vaccine is \$9.71. A comparable mercury-free package (each with 10 doses) costs \$12.02 per dose.

- **Thimerosal** (49.6% ethyl mercury) has never been tested for safety and no proof exists that it is safe. On the contrary, there are thousands of documents in the literature that discuss its extreme toxicity, starting with Thimerosal's own Material Safety Data Sheet that, amongst other things, states:

"Exposure Guidelines: Thimerosal - no known occupational limits established... Exposure to mercury in utero and in children can cause mild to severe mental retardation and mild to severe motor coordination impairment... Target Organ Effects: Mercury - Nervous system effects (insomnia, tremor, anorexia, weakness, headache), liver effects (jaundice, digestive effects (hypermotility, diarrhea)."

- The Centers for Disease Control released a study in Pediatrics that cited a correlation between **thimerosal-containing vaccines** and both "tics" and "language delay" in children.

- On Friday, October 27, 2006, the Coalition for Mercury-free Drugs (CoMeD) filed an amended complaint in U. S. Federal Court, disputing the FDA response it received on September 26, 2006, defending the use of mercury in medicine. CoMeD is asking the court to compel the FDA to: comply with the law, follow existing regulations, and provide proof of the safety and efficacy of mercury in drugs. The lawsuit was originally filed in August 2006 because the FDA had failed to answer the issues raised in a CoMeD citizen petition (FDA Docket: 2004P-0349), filed on Wednesday, August 4, 2004, by representatives from CoMeD. Of concern is that mercury, which is second only to plutonium in toxicity, remains in at least 45 different prescribed and over-the-counter drugs (according to the FDA), including various eye ointments, ear solutions, nasal sprays, vaccines, biologics, and perhaps most importantly, in flu vaccines currently being administered to millions of pregnant women, children, and the elderly.

Thimerosal-containing flu vaccines are routinely given to pregnant women, children, and adults.
